

Precalc Lesson 0.6 Homework

Answer Key

1. $y - 2 = -\frac{1}{5}(x + 7)$

2. C

3. $x = -8$

4. $k = -7$

5. D

6. No; an x increase of 6 units produces a y increase of 15 units. $\frac{43}{2} - \frac{15}{2} = 14$, which should produce an increase of $\frac{7}{3}$ (15 units) = 35 units. $20 + 35 = 55 \neq 53$, so the point $(\frac{43}{2}, 53)$ is not on the line.

7. B

8. a. Fitness Frenzy® because the price does not depend on the number of times visited.
b. None, a perpendicular line would have to have a negative slope, which none of these pricing schemes do. It doesn't make sense for the total monthly price to decrease as you go to the gym more.
c. \$28 one-time registration fee and \$4 for every time you visit (one-time registration fee (y - intercept) has changed, but price per visit (slope) is the same)
